

CHUNKING

What is it : The act of dividing information into small units so that it sits in the reader's short term memory and it is easy to recall when needed. Can also be used for problem solving.

Example : 2613822994 chunked to 261.382.2994

 chunked to 

Note : Order of these chunks can be important (mobile number) or not (colored squares) based on information type.

Existing Example

Stations and Lines of New York

Screenshot from : c82, Nicholas Rougeux

A visual catalogue of every station in major rapid transit systems and the lines they serve in the city of New York.

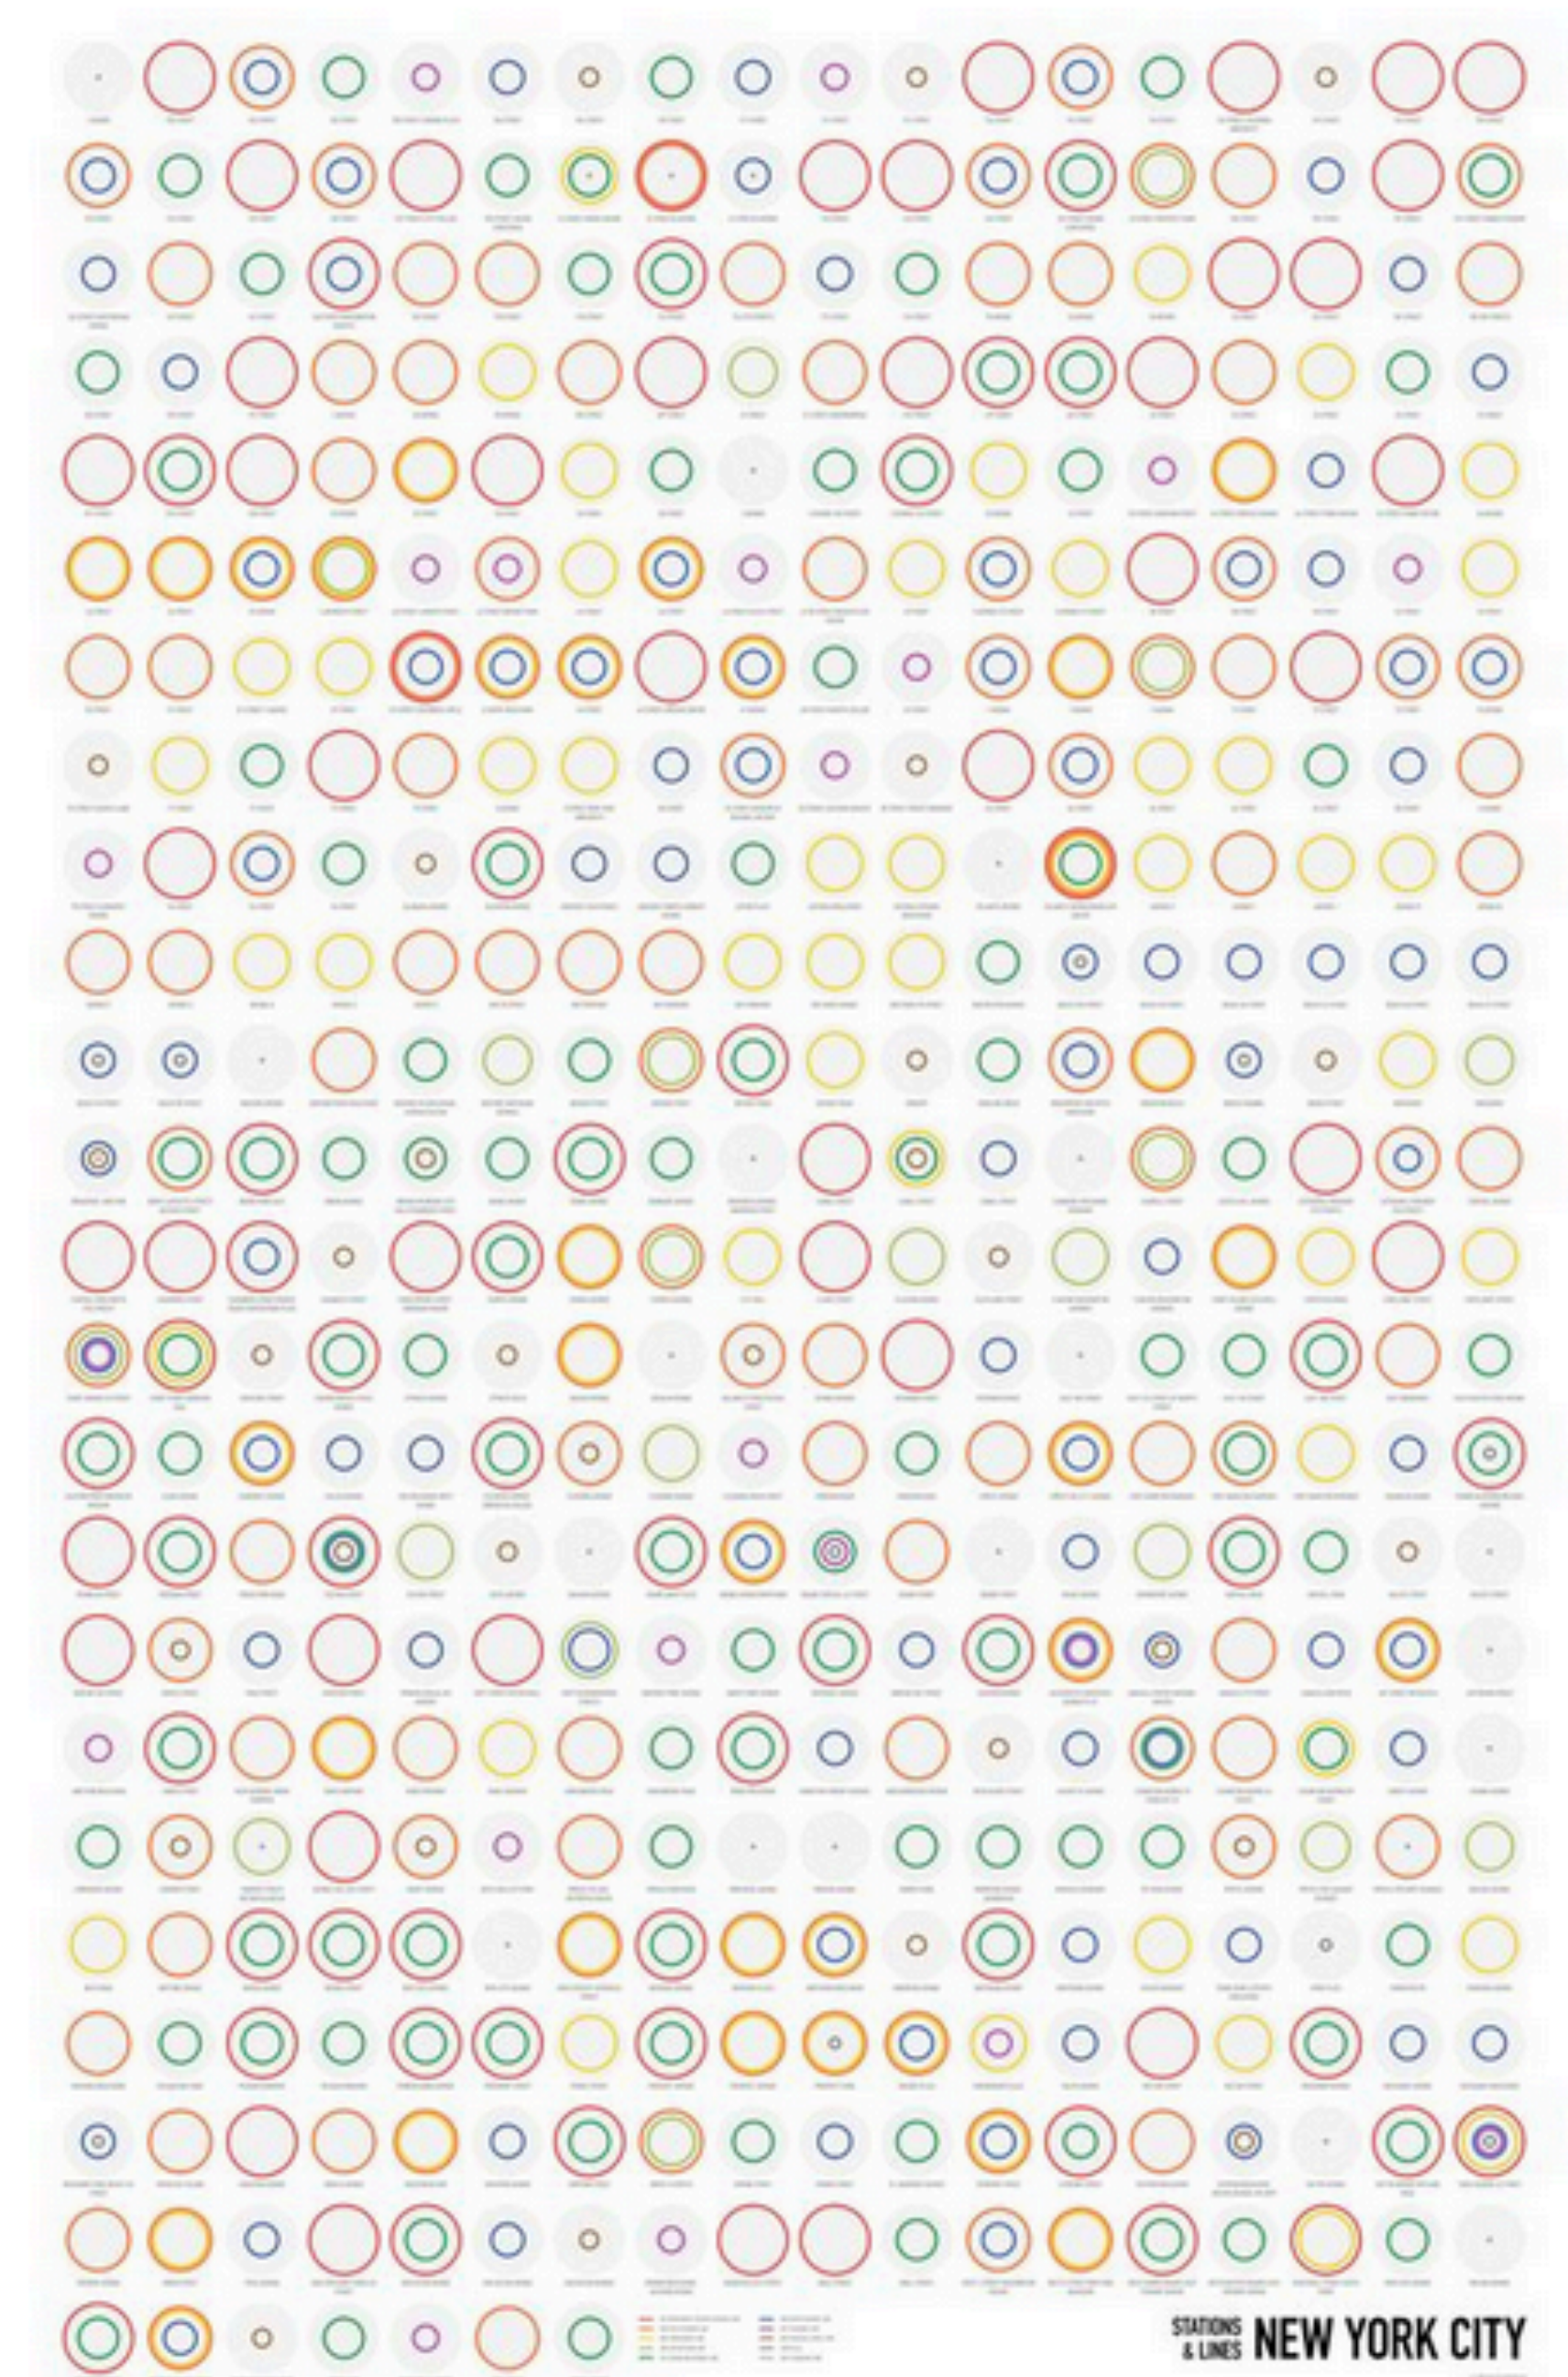

How To Read

About Chunking

Instead of focusing on every line within the city, it divides information based on every station, allowing the reader to see the station as a whole instead of being a part of a line.

This is useful when the reader wants lines to access stations and is new to the city.

My Idea of Chunking

... is to make you remember that DC has the most number of Chipotle per 1000 sq. miles than any other state
